Welcome to the IEM Department Newsletter!

Stay informed and connected with the latest updates on departmental events, research breakthroughs, student achievements, and faculty highlights. From academic milestones to innovations in teaching and learning, we bring you stories that reflect the vibrant life of the Industrial Engineering and Management community.

This newsletter also showcases extracurricular activities, including hackathons, technical fests, cultural events, and student club initiatives. We aim to foster collaboration, creativity, and leadership among students while providing a platform to explore interests beyond the classroom.

We hope this newsletter leaves you feeling informed, connected, and proud.

Warmly,
The Editorial Team.

The Human-Centric Interface: Ergonomics in the Age of AI and IoT

1.0 Evolution of Ergonomics

Ergonomics began in the early 20th century with a focus on fitting tools and workplaces to human physical capabilities, largely driven by industrialization and military needs. Early studies emphasized anthropometry, biomechanics, and fatigue reduction, aiming to improve efficiency and safety in factories and cockpits. World War II accelerated its growth, as engineers and psychologists collaborated to design controls and displays that matched human perceptual and motor abilities, laying the foundation for human factors engineering.

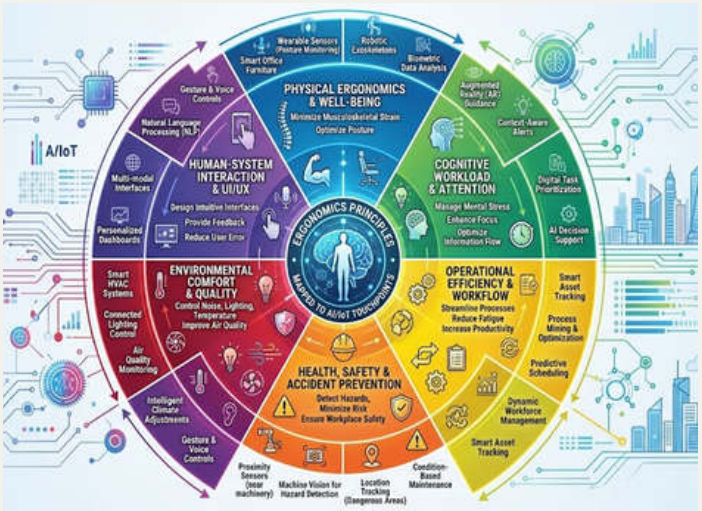

In the late 20th and 21st centuries, ergonomics evolved into a multidisciplinary science encompassing cognitive, organizational, and digital domains. It expanded beyond physical comfort to address mental workload, usability, and human–computer interaction. Today, ergonomics integrates principles of inclusive design, accessibility, and user experience, shaping everything from office furniture and automotive dashboards to complex socio-technical systems and AI-driven interfaces. Its evolution reflects a shift from "fitting humans to machines" toward "designing systems around human diversity and capability."

In the infographics, the six major stages of ergonomics evolution, from Ancient Civilisations (basic tools and pulleys) through the Industrial Revolution (time-motion studies), World War II (cockpit design), the Post-War Era (human factors research), the Computer Age (HCI), and finally Industry 4.0 (AI, VR, wearables, exoskeletons). Each stage is illustrated with icons and short descriptions, making it easy to trace how ergonomics advanced alongside technology.

2.0 Modern View of Ergonomics

The modern industrial and occupational landscape is undergoing a radical transformation, driven by the convergence of Artificial Intelligence (AI) and the Internet of Things (IoT). From smart factories leveraging predictive maintenance to integrated healthcare systems monitoring vital signs, these technologies promise unprecedented efficiency and connectivity. However, this technological leap introduces complex, novel challenges to the field of ergonomics. For Engineers preparing to design the next generation of systems, a critical understanding of human factors within AI and IoT ecosystems is paramount to ensuring safe, efficient, and user-friendly environments.

3.0 Ergonomics using AI and IoT Across Sub-Domains.

Ergonomics in the era of AI and IoT encompasses several sub-domains:

- Physical Ergonomics & Well-being: Wearable sensors and robotics reduce strain and improve posture.
- Cognitive Workload & Attention: AR guidance and AI support help manage mental stress and enhance focus.
- Operational Efficiency & Workflow: Asset tracking and predictive scheduling streamline tasks.
- Health, Safety, & Accident Prevention: Machine vision and location tracking enhance workplace safety.
- Environmental Comfort & Quality**: Smart HVAC and connected lighting automate adjustments for comfort.
- Human-System Interaction & UI/UX: Gesture controls and natural language processing create intuitive interfaces.

(Source of Image; - Image generated using Prompting using Nano Banana Gemini 2.0 Tool)The use of the Technology, along with principles & touch points, is summarized below.

Principle	Touch point	Tech example
Physical Comfort	Wearable Sensors	EMG / Posture AI
Cognitive Load	AI Voice Assistants	LLM NLP Interface
Feedback & Response	Haptic Actuators	Smart Textiles
Accessibility & Inclusion	Adaptive UI Systems	AR / Voice Controls
Safety & Control	Edge AI Failsafe	Kill-switch Protocols
Learnability	Contextual Onboarding	Guided AR Walkthroughs

4.0 Challenges and Complexities in Ergonomics in the age of AI and IoT:

The rise of Artificial Intelligence (AI) and the Internet of Things (IoT) has transformed the relationship between humans and machines, creating new ergonomic challenges. A key example is the increasing use of collaborative robots (cobots), which work alongside humans rather than being separated by safety barriers. This requires careful design of shared workspaces, including safe interaction zones, effective collision avoidance systems, and clear communication between workers and robots. In addition, workers are now expected to monitor, supervise, and occasionally intervene in automated processes. As a result, interfaces must communicate the cobot's intentions, status, and risks clearly without overwhelming users with excessive information.

Beyond manufacturing, IoT devices have introduced further complexities by generating large amounts of real-time data. Smart sensors are now used to monitor equipment, environmental conditions, and workplace performance. While this data can improve efficiency, poorly designed systems may create cognitive overload. For instance, dashboards with excessive alerts or confusing visualizations can lead to "alert fatigue," causing users to ignore critical warnings. Ergonomic design therefore focuses on presenting information in a simple, intuitive manner through effective dashboards, appropriate alert systems, and transparent data practices that maintain user trust.

One critical intervention involves designing for trust and transparency in AI. When an AI system, such as a scheduling algorithm or a diagnostic tool, makes a decision, the user must understand why that decision was made—the coTo address these challenges, ergonomic principles must be integrated into the engineering design process. One important intervention is designing AI systems that promote trust and transparency. Through Explainable AI (XAI), users can understand how and why decisions are made. Interfaces should clearly display the reasoning, confidence levels, and key data behind AI recommendations. This helps prevent both overreliance on automation and unnecessary distrust of accurate systems.

Another intervention involves optimizing physical and environmental conditions in smart workplaces. IoT-enabled systems can adjust lighting, temperature, and other factors to improve comfort and productivity. Wearable devices should also be designed to be comfortable, non-intrusive, and supportive of natural movement.

Finally, organizations must focus on training and skill development. Workers need the ability to monitor automated systems, evaluate AI outputs, and collaborate effectively with technology. Simulation-based training and practical feedback can help build these skills, creating a productive partnership between humans and intelligent systems.

ncept of Explainable AI (XAI). A human factors approach demands that the AI interface clearly communicates its confidence level, the key data points it used, and the logic behind its recommendation. Without this transparency, users may either blindly over-rely on a flawed system (automation bias) or completely distrust a correct one, leading to suboptimal performance or dangerous workarounds.

5.0 Points to ponder for the Future of AI-enabled Ergonomics:

- Ethical-Ergonomics Dilemma: If an AI system detects a minor, non-critical safety violation by a human worker (e.g., momentarily leaning into a restricted zone), what is the most ergonomic and ethical way for the system to respond? Is it a soft haptic warning, a verbal command, or an automatic system slowdown? How do you balance safety with not disrupting the worker's flow?
- The Data Privacy vs. Personalization Trade-off: To optimize a worker's environment for maximum comfort and productivity, an IoT system needs continuous, personal data (e.g., heart rate, posture, thermal comfort history). Where the engineering line should be drawn between collecting data for optimal ergonomic personalization and respecting the worker's right to privacy and freedom from surveillance?
- Cognitive Offloading: AI promises to reduce human cognitive load by handling complex scheduling or data analysis. However, constant reliance on AI can degrade a worker's innate skills and critical judgment. How can engineers design collaborative AI systems that strategically on-load certain critical tasks back to the human periodically, ensuring skill maintenance and critical vigilance?

Thus, the future of ergonomics lies in ethical symbiosis between humans and intelligent systems—where safety, privacy, and cognition are harmonized through thoughtful design. By embedding empathy into automation, engineers can create workplaces that are not only efficient but also humane, preserving the essence of human judgment and well-being in an increasingly algorithmic world.

DR. N.S. NARAHARI
VISITING PROFESSOR
DEPT OF IEM, RVCE

Alumni Speaks

The Long Way Round

How a quietly underrated degree in Industrial Engineering and Management became the blueprint for everything I have built since

When people ask me what I studied, I have learned to pause before I answer. Industrial Engineering and Management is not a household name in India the way Computer Science or Mechanical Engineering are. Most people nod politely and assume it is something adjacent to a factory. What they do not realise is that they are standing inside its legacy every single day. The just in time systems that decide when a product reaches a shelf, the lean thinking that strips waste out of a process, the quiet choreography that lets a shop floor and a management cabin speak the same language, all of that lives in the world of industrial engineering. It is one of the most consequential and least understood disciplines I know, and I had the good fortune of meeting it at RV College of Engineering before I understood what it would do for me.

I did not arrive with a master plan. I arrived with a kind of restless curiosity about how things are made, how businesses actually run, and why some products feel inevitable while others are forgotten within a season. At the time I could not have told you that this single curiosity would carry me from a classroom on Mysore Road to Paris, to a startup incubated at the University of California, Berkeley, into my family business, and finally to building a consumer brand of my own. I only knew that IEM allowed me to ask all of those questions in the same four years, and refused to make me choose between the world of the engineer and the world of the manager. That refusal, I now believe, was the whole point.

IEM is an unusual degree, and that is its quiet genius. In a single week you might wrestle with Strength of Materials in the morning and walk into a Financial Management class in the afternoon, and the two could not feel further apart. One asks how a beam behaves under load. The other asks how money behaves under pressure. For four years you learn to move between the language of the factory floor and the language of the boardroom, and somewhere in that constant switching a different kind of mind is built. I have come to think of it as the closest thing engineering offers to an entrepreneur's education, because an entrepreneur is exactly the person who must think about materials, money, and people on the same afternoon, and then make a decision that touches all three.

That blend stopped being theory the day I started building HIVADO. HIVADO is a men's grooming and skincare brand I founded, built for the modern Indian man who wants formulations that are genuinely science backed rather than merely marketed, presented with a design sensibility that holds its own anywhere in the world. We distribute across Amazon, quick commerce platforms like Blinkit and Zepto, Flipkart, premium retail, and our own direct to consumer channel. From the outside, a grooming brand looks like an exercise in marketing, in fragrance and packaging and a well shot campaign. From the inside, it is a living textbook of everything the IEM department ever tried to teach me, and the subjects I once treated as separate boxes turned out to be a single connected system

Consider what it actually takes to put one bottle in one customer's hands. On one side there is marketing, the storytelling and positioning that makes someone reach for the product. Behind it sits finance, the unit economics and margins that decide whether the business breathes or suffocates. And underneath all of it runs an entire operation, the part the customer never sees, where formulations are manufactured, factories are audited, packaging is tested, and stock is moved through a supply chain that has to arrive at exactly the right moment. Supply Chain Management and Lean Manufacturing, the very subjects Dr. K N Subramanya was known for, are now the rhythm of my week. When a formulation gets upgraded, the packaging changes, a barcode changes with it, and a single product can suddenly stall in a marketplace approval queue while inventory sits idle. The vocabulary I reach for to untangle that, lead times, bottlenecks, just in time replenishment, the smooth flow of goods through a system, is the exact vocabulary I first met as a student. The professor was teaching a case study. I was quietly rehearsing my future job.

Operations Management, Operations Research, and Production Engineering gave me the instinct to see a business as a set of interlocking processes rather than a pile of disconnected tasks. When I audit a manufacturing facility today, I am not lost, because IEM taught me to read an entire industrial operation rather than just one station of it. I can walk a floor and sense where quality is being won or lost, where a process is leaking time, where a small change upstream will ripple all the way to the customer. Statistics and Quality Control, in particular, have become almost daily companions. Every batch of product carries a promise to a person who will never see how it was made, and that promise is kept or broken long before anything reaches a shelf. The habit of asking what the data actually says, of refusing to trust a gut feeling where a measurement is possible, was planted in those classrooms.

Then there is Strength of Materials, the course a younger me was certain he would never use again. I think about it constantly. When we choose packaging, we are really asking how a material will behave under stress, in transit, on a shelf, inside a humid bathroom day after day. Metrology and the discipline of measurement taught me that precision is not pedantry, it is respect for the customer. Management Information Systems showed me how information itself flows through an organisation and becomes the basis for decisions, which is precisely what dashboards and data do for a modern brand. Human Resource Management and Organizational Behaviour taught me the quietest and most lasting lesson of all, that a company is not a product, it is a group of people, and that placing the right person in the right role is as much a design decision as any formulation. Building a team has been among the hardest and most rewarding parts of my journey, and I trace its first principles to those discussions about how people truly behave inside organisations.

Some of what the department gave me felt almost prophetic in hindsight. Long before I had a brand worth protecting, Dr. Chaitra walked us through Intellectual Property Rights, a subject that seemed abstract to a young engineering student and now sits at the very centre of how I think about building something defensible and original. The day I first sat with trademarks and brand protection for HIVADO, I realised she had handed me that map years in advance. Financial Management, meanwhile, taught me to read a business the way a doctor reads a chart, to look past the surface of a thing to the numbers underneath. When I sit across from an investor today and we talk about margins, payback, and the slow patient work of building something durable, I am simply using a habit the department gave me long ago.

None of this happened by accident, and I owe it to a faculty who taught far more than a syllabus. Dr. Rajeswara Rao, was instrumental in shaping how I understand Engineering Management itself, the idea that technical capability and managerial judgement are not rivals but partners. Around the technical faculties stood teachers of Management and Entrepreneurship, Human Resource Management, Marketing, Operations Management, and Organizational Behaviour, each one adding another instrument to an orchestra I did not yet know I was learning to conduct. They were not merely delivering lectures. They were modelling a way of thinking that refused easy boundaries, and that example outlasted every formula I have since forgotten.

If the classroom built the foundation, the corridors outside it built the courage. Some of my sharpest memories from RVCE have nothing to do with examinations. I helped organise our departmental fest, the 8th Mile, and I learned more about leadership in those chaotic weeks than in any single semester. You become suddenly responsible for logistics, sponsors, people, deadlines, and a hundred small fires burning at once, and you find out whether you can hold a vision steady while everything around it moves. That is not so different from a product launch at a startup, and I felt strangely prepared for my first one because I had already lived a smaller, louder version of it as a student. The other experience that shaped me was serving as President of SIFE, Students In Free Enterprise. We built projects rooted in social entrepreneurship, the simple and stubborn belief that a well designed enterprise can solve a real problem for real people and sustain itself while doing so. That is where my conviction that business and impact belong together first took root. I have never since been able to see them as separate pursuits, and SIFE is where they first met in me.

I want to be honest with whoever is reading this as a current student, perhaps quietly wondering where a degree this broad can possibly lead. For a while I worried that not specialising would leave me behind. The opposite turned out to be true. The breadth was the advantage. When I went on to study at ESSEC Business School in Paris and later worked with houses like LVMH on brand and storytelling, I was often the rare person in the room who could speak about both the soul of a product and the supply chain behind it. When I helped build a skintech startup incubated at Berkeley's SkyDeck, the engineering instinct and the management instinct were already both in my hands. When I stepped into my family business, I understood operations and people and numbers as a single connected whole rather than three foreign languages. None of it felt like a leap. It felt like the natural unfolding of a degree that had quietly trained me to stand between worlds and feel at home there.

That, in the end, is the gift I most want to name. The analytical mind of an engineer and the strategic eye of a manager are usually grown in separate people. IEM grows them in the same person, almost without announcing it. It is the only course I know that hands you both halves of the world and trusts you to put them together. My own path has not been a straight line. The detours through Paris and Berkeley, through a family business and the long slow build of HIVADO from an idea into a brand, all rest on a foundation poured during four years in this department. I walked in curious and a little uncertain. I walked out with a way of seeing the world that has never once let me down. If you are reading this from inside those same classrooms, know that the in between place this degree puts you in is not a weakness to grow out of. It is the most useful place I know. It is where things get built.

Sainath Jain
2007-2011 IEM
Founder, HIVADO

Workshops, Conferences and Seminars

AUKOM 1 - Training and Certification Course, 24th – 26th March 2026

Co-ordinator: Nandini B, Dept. of IEM, RVCE

The Department of Industrial Engineering & Management, in collaboration with Carl Zeiss India (Bangalore) Pvt. Ltd., successfully organized the AUKOM 1 Training and Certification Course for students. The intensive three-day programme was designed to bridge the gap between academic learning and industrial practice by providing participants with comprehensive training

The training was in the area of metrology, precision measurement systems, and quality assurance techniques. Students gained valuable hands-on exposure to Coordinate Measuring Machines (CMMs), their operation, measurement strategies, and their critical role in ensuring product accuracy and manufacturing excellence.

AUKOM (Advanced Users of Coordinate Measuring Machines) is an internationally recognized certification standard in the field of industrial metrology, and achieving Level 1 certification represents an important milestone in a student's technical and professional development. The programme enabled students to develop industry-relevant skills, strengthen their understanding of modern measurement technologies, and enhance their readiness for careers in advanced manufacturing and quality engineering. A total of 70 students actively participated in the training and successfully benefited from the certification programme.

Study in Europe Awareness Event - 22nd April 2026

Co-ordinator: Dr. Vikrman N B, RVCE–INDOGERMAN Collaborative Cell

The RVCE–INDOGERMAN Collaborative Cell organized a "Study in Europe" Awareness Event at the Design Thinking Huddle, RV College of Engineering. The event facilitated direct interactions between students and delegates from leading European universities, offering comprehensive information on international higher education opportunities, scholarship programmes, visa processes, and admission requirements. The session was designed to guide students in making informed decisions about pursuing postgraduate studies abroad. A total of 100 students participated in the event.

Business Culture and Characteristics of Japanese Companies - 27th April 2026

Coordinator: Dr. Ramaa A, Organized by: Placement Department, RVCE

Kazumitsu Kuroda from the Japan Productivity Center conducted a seminar on "Business Culture and Characteristics of Japanese Companies." The session explored Japanese corporate culture, workplace values, and management philosophies like Kaizen, Monozukuri, and Omotenashi, which contribute to Japan's reputation for quality and excellence. Students learned how these cultural values manifest in workplace practices, gaining a valuable cross-cultural business perspective. The event attracted 250 enthusiastic participants.

Overview of Electronics Manufacturing Industry in India and Globally - 28th April 2026

Coordinator: Dr. Ramaa A, Organized by: Placement Department, RVCE

An expert talk titled "Overview of Electronics Manufacturing Industry in India and Globally" was presented by Dr. Ing. Sirous Etemadi. The session provided students insights into India's growing semiconductor ecosystem under the PLI scheme and global trends in automotive electronics, IoT, and smart manufacturing.

Ing. Sirous Etemadi delivered an expert talk on the "Overview of Electronics Manufacturing Industry in India and Globally." The session provided students insights into India's semiconductor ecosystem under the PLI scheme and global trends in automotive electronics, IoT, and smart manufacturing.

Conference Presentations:

Papers presented at Advanced multidisciplinary innovations in science & Engineering for Industry 5.0(AMISE 5.0)" organised by Dayananda Sagar Academy of Technology and Management Hosted by Department Of Mechanical Engineering from 30th March – 3rd April 2026.

Dr. Kiran V, Harsh Verma, Gaurav R, Mahi Garg, Dr. M. N. Vijay Kumar, Dr. Vinay V Hegde presented a paper on "Automatic Video Content Summarization Using Whisper-Based Speech Transcription And Bart Language Model With Performance Evaluation".

Prabhav Rajan, R S Krupa, Srividya Sriraman, M. N. Vijaya Kumar presented a paper on "Ai-Based Screw Presence Detection System For Assembly Line Error Prevention Using Computer Vision And Arduino"

Manogyna N, P Sanjana, Prashanth Kabin Selvam, Dr Vijayakumar MN, Dr M N Guru Raja2presented a paper on "AI-Assisted Assembly Line Balancing And Quality Optimization In Automotive Manufacturing"

Faculty Participation in Workshops, Seminars & Conference

Faculty actively participated in national-level Faculty Development Programmes and workshops — sharpening their expertise in Artificial Intelligence, research methodologies, and innovative pedagogy, and bringing back cutting-edge knowledge to enrich the learning experience.

FDP on SAILStrategic AI Leadership

Dr. Ramaa A | Online | 16 – 21 March 2026
MMTTP, IIT Ropar

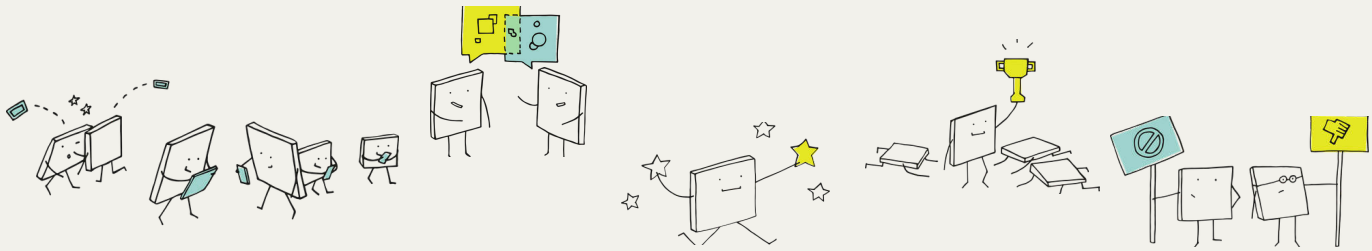

Dr. Ramaa A participated in the six-day online "SAIL: Strategic AI Leadership" program at IIT Ropar, organized by MMTTP. The program focused on leadership strategies and integrating Artificial Intelligence in academia. Participants learned about AI-led institutional transformation and embedding AI tools in curriculum design and research, preparing faculty to lead in an AI-driven educational landscape.

FDP on Innovative Teaching and Learning Pedagogy

Nandini B | Online | 16 – 21 March 2026
Research Foundation of India

Prof. Nandini B attended a Faculty Development Programme on "Innovative Teaching and Learning Pedagogy" by the Research Foundation of India. The program focused on modern, learner-centric methodologies and active learning strategies, aiming to help faculty enhance student engagement and learning outcomes through evidence-based practices.

Gen-AI and Agentic Intelligence

Dr. Vikram N B & Prof. Nandini B | 06 – 10 April 2026
R.V. College of Engineering in association with CSIR – Fourth Paradigm Institute
IEEE Bangalore Section

Vikram N B and Prof. Nandini B participated in a Five-Day Hybrid Faculty Development Programme on "GenAI and Agentic Intelligence." The workshop offered insights into Generative AI technologies, Agentic Systems, and their applications in academia and industry. Faculty gained practical experience with new AI tools and discussed integrating these technologies into teaching and research to keep pace with the evolving AI landscape.

FACULTY DEVELOPMENT PROGRAMME AND INDUSTRIAL WORKSHOP
(Technically Co-Sponsored by IEEE Bangalore Section)

Mastering AI Driven Research: Powerful Techniques, Tools and Proven Practices

Dr. Vivekanand S Gogi | ONLINE | 07 – 11 April 2026
Department of Mechanical Engineering, SJB Institute of Technology

Vivekanand S Gogi participated in a Five-Day National Level Faculty Development Programme on "Mastering AI Driven Research." The program covered AI research methodologies, digital tools like AI literature review assistants and citation managers, and techniques for publishing impactful academic work. It aimed to enhance faculty research productivity in the AI era.

Sri Adichunchanagiri Shikshana Trust (R)

Industrial Visit

A Journey into Modern Industrial Practices

Amazon Fulfilment Centre (BLR8), Bengaluru

The Department of Industrial Engineering and Management, RV College of Engineering, organized an industrial visit to Amazon Fulfilment Centre (BLR8), Bengaluru, on 24th April 2026. A group of 24 students and one faculty coordinator participated in the visit to gain practical exposure to large-scale warehouse operations, supply chain management, and industrial engineering applications.

During the visit, students observed the complete fulfilment process, including inbound operations, product dimensioning, inventory storage, order picking, sorting, packaging, and outbound dispatch. The facility demonstrated advanced technologies such as the Warehouse Management System (WMS), barcode scanning, conveyor systems, and automated dimensioning tools that enable efficient and accurate order fulfilment.

Coordinator: Prof. Bhaskar M G

Student Achievements

The **Enigma Dance Team** has consistently excelled in intercollegiate cultural competitions, earning recognition for its talent and teamwork. **Saptarshi Mandal, 4th sem** student, an active member of the team, contributed to its success in securing 1st place at St. Xavier's Institute, BMSIT, BMSCE, East Point Group of Institutions, Dayananda Sagar College of Engineering, MVJ College of Engineering, SEA Group of Institutions, JSS Academy of Technical Education, and SJB Institute of Technology, along with 2nd place finishes at PES University, NITK Surathkal, and SSN College of Engineering.

The Women's Football Team delivered an exceptional performance at the VTU Tournament 2026, demonstrating remarkable teamwork, resilience, and sportsmanship throughout the competition. Their dedication and consistent efforts earned them the 1st Place title, bringing great pride to the institution.Among the team members, Poorvi Girish, a 2nd Semester student, played an important role in this achievement. The victory reflects the team's commitment to excellence and their growing presence in collegiate sports.

Pavan R. Sheshagiri, a 4th Semester student and member of the college cricket team, contributed to the team's victory in the VTU Inter-Collegiate Men's State-Level Cricket Tournament. He also secured the Runner-up position in the VTU Inter-Collegiate Bangalore South Division Men's Cricket Tournament, highlighting his talent and dedication to the sport.

Maanav Talwar, a 4th Semester student, showcased exceptional communication, critical thinking, and public speaking skills at the Vimarsha BMSCE Debating Tournament 2026, where he secured the Runner-Up position. His achievement reflects his ability to present compelling arguments and engage effectively in competitive debate.

The RVCE Women's Hockey Team showcased determination, teamwork, and competitive spirit at the State-Level Hockey Tournament held at ASC College. The team secured an impressive 4th Place, reflecting their hard work and commitment to the sport.

Ritika Ghattad, a 4th Semester student, was an integral member of the team and contributed to this achievement through her dedication, perseverance, and sportsmanship throughout the tournament.

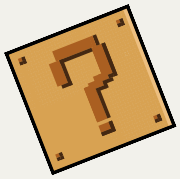

The Kho-Kho Team displayed outstanding teamwork and determination, winning the VTU State-Level Interzones and South Zone Kho-Kho Tournaments. Kushal N.C., a 2nd Semester student, contributed to these successes through dedication and discipline, showcasing the team's hard work and competitive spirit.

Adhar Chaudhari, a 2nd Semester student, showcased exceptional innovation and problem-solving at "The Lazarus Missions: Nuclear Winter" hackathon by the National Institute of Technology Karnataka. Competing with talented undergraduates, he developed effective solutions and secured 1st Place in the UG Batch 2029 Category, demonstrating his technical skills, teamwork, and commitment to excellence in technology.

Think Space

1. **I am everyone's responsibility,
But often nobody's job.
If I disappear, customers notice immediately.
What am I?**

2. **I make products travel shorter distances,
Though I never move myself.
I rearrange a factory without touching a machine.
What am I?**

3. **I am counted but never sold,
Tracked but never used directly.
Too much of me costs money,
Too little of me causes panic.
What am I?**

4. **I can stop a thousand workers,
Even though I'm only one machine.
The entire factory waits for me,
Who am I?**

ANSWERS:
1. Quality 2. Facility Layout 3. Inventory 4. Bottleneck
