

MARKETING MANAGEMENT

Course Code: IM345AT | Semester IV | L:T:P 3:0:0 | 45 Hours

UNIT IV

Web Design & Mobile Marketing

Unit IV covers the two surfaces on which the customer actually meets the brand. The first half is web design — designing, optimising and publishing a website, user-centred design, design principles, website copy, and the metrics that turn a site into an instrument. The second half is mobile marketing — how it differs from mobile advertising, and how apps, push notifications and geo-targeting drive sales promotion.

TOPICS COVERED IN THIS UNIT

Web Design: Web design, optimization of websites; Publishing a basic website; User-centered Design and Website Optimization; Design Principles and Website Copy; Website Metrics & Developing Insight.

Mobile Marketing: Difference between mobile advertising and marketing; utilizing mobile marketing for sales promotions; online applications.

ABOUT THESE NOTES

These notes are **unofficial**. They have been documented by students from **Vikram Sir's handwritten notes, lecture slides and classroom sessions**, and restructured to follow the official IM345AT syllabus unit by unit. Where the source notes were incomplete, the gaps have been filled from standard marketing-management texts and clearly integrated into the same flow. Every previous-year question in the question bank at the end has been extracted verbatim from the actual RVCE CIE and SEE papers for this course. This document is a study aid and is not issued, endorsed or verified by the Department of Industrial Engineering and Management or by RV College of Engineering. Always cross-check against the official syllabus and your own class notes.

Semester: IV						
MARKETING MANAGEMENT						
Category: Professional Core Course (Theory)						
Course Code	:	IM345AT		CIE Marks	:	100 Marks
Credits: L:T:P	:	3:0:0		SEE Marks	:	100 Marks
Total Hours	:	45L		SEE Duration	:	3.00 Hours
UNIT-I						07Hrs
Introduction to Digital Marketing: Principles of Digital Marketing; Digital Marketing Channels; Tools to Create Buyer Persona; Competitor Research Tools, Website Analysis Tools, etc. Content Marketing: Content Marketing Concepts & Strategies; Planning, Creating, Distributing & Promoting Content; Optimize Website UX & Landing Pages; Measure Impact; Metrics & Performance; Using Content Research for Opportunities, etc.						
UNIT-II						08Hrs
Social Media Marketing: Introduction; Major Social Media Platforms for Marketing; Developing Data-driven Audience & Campaign Insights; Social Media for Business; Creation & Optimization of Social Media Campaigns, etc. Search Engine Optimization: Search Engine Optimization Fundamentals; Keywords and SEO Content Plan; SEO & Business Objectives; Writing SEO Content; On-site & off-site SEO; Optimize Organic Search Ranking, etc.						
UNIT-III						07Hrs
Web Analytics & Google Analytics: Google Analytics Tools; Web Analytics Tools, etc. E-mail Marketing: Effective E-mail Campaigns; E-mail Plan; E-mail Marketing Campaign Analysis; Measuring Conversions & keeping up, etc.						
UNIT-IV						07Hrs
Web Design: Web design, optimization of websites; Publishing a basic website; User-centered Design and Website Optimization; Design Principles and Website Copy; Website Metrics & Developing Insight, etc. Mobile Marketing: Difference between mobile advertising and marketing, utilizing mobile marketing for sales promotions, online applications, etc.						
UNIT-V						07Hrs
Conversion Optimization: What is AIDAS and its role; website optimization; what visitors want to see on the website; how to optimize key element and increase the effect of landing on a particular page Digital Analytics: Evolution of Digital Analytics, information about end-to-end customer experience, analyst's influence on business, role as a change agent, etc.						

Course Outcomes: After completing the course, the students will be able to	
CO1	Differentiate the benefits drawn by updated marketing mix from traditional marketing mix for effective marketing management there by to stay competitive in today's global market-place.
CO2	Develop an effective holistic marketing atmosphere to efficiently face the challenges in dynamically changing market.
CO3	Formulate a potential marketing plan to effectively reach the targeted market segments, by delivering the value to targeted customers through practicing sound marketing research.
CO4	Create new channels to improvise marketing to achieve and maintain competitive position in globalized market-place.

RUBRIC FOR THE CONTINUOUS INTERNAL EVALUATION (THEORY)		
#	COMPONENTS	MARKS
1.	QUIZZES: Quizzes will be conducted in online/offline mode. TWO QUIZZES will be conducted & Each Quiz will be evaluated for 10 Marks. THE SUM OF TWO QUIZZES WILL BE THE FINAL QUIZ MARKS.	20
2.	TESTS: Students will be evaluated in test, descriptive questions with different complexity levels (Revised Bloom's Taxonomy Levels: Remembering, Understanding, Applying, Analyzing, Evaluating, and Creating). TWO tests will be conducted. Each test will be evaluated for 50 Marks, adding upto 100 Marks. FINAL TEST MARKS WILL BE REDUCED TO 40 MARKS.	40
3.	EXPERIENTIAL LEARNING: Students will be evaluated for their creativity and practical implementation of the problem. Case study-based teaching learning (10), Program specific requirements (10), Video based seminar/presentation/demonstration (20) ADDING UPTO 40	40
MAXIMUM MARKS FOR THE CIE THEORY		100

RUBRIC FOR SEMESTER END EXAMINATION (THEORY)		
Q. NO.	CONTENTS	MARKS
PART A		
1	Objective type questions covering entire syllabus	20
PART B (Maximum of TWO Sub-divisions only)		
2	Unit 1: (Compulsory)	16
3 & 4	Unit 2: (Internal Choice)	16
5 & 6	Unit 3: (Internal Choice)	16
7 & 8	Unit 4: (Internal Choice)	16
9 & 10	Unit 5: (Internal Choice)	16
TOTAL		100

4.1 Web Design — Concepts

4.1.1 What Web Design Is

DEFINITION — CIE-III, June 2026 (10 marks)

Web design involves creating visually appealing and user-friendly websites. It includes **layout design, colour selection, typography, graphics, navigation and responsiveness**.

Web design is not decoration. In marketing terms the website is the **hub of the entire digital campaign ecosystem** — the 24/7 portal and the ultimate conversion destination that every other channel feeds. A design decision is therefore a revenue decision.

4.1.2 The Two Halves — UI and UX

SEE Oct/Nov 2023 asked (Q7a, 8 marks): “*What is the role of user Interface and user Experience designs in web design for marketing?*”

	User Interface (UI)	User Experience (UX)
Definition	The visual and interactive surface the user touches — layout, colours, typography, buttons, icons, spacing, states	The entire quality of the user's journey — how easy, efficient and satisfying it is to achieve their goal
Scope	What it looks like and how it responds	How it feels and whether it works
Deliverables	Style guides, design systems, mockups, component libraries	Personas, user journeys, wireframes, information architecture, usability test findings
Marketing role	Creates the first impression and signals brand credibility within milliseconds	Determines whether the visitor converts, returns and recommends
Failure symptom	Site looks dated or inconsistent; brand appears untrustworthy	Users cannot find what they need; high bounce, low conversion

Ensuring a positive user journey: map the journey before designing; keep navigation shallow and conventional; make the primary action obvious on every page; minimise the number of steps to the goal; provide feedback for every action; design the error and empty states, not just the happy path; make the site fast and responsive; and test with real users rather than colleagues.

4.1.3 Website Structure — The Basic Pages

- **Home page** — states what the business does, for whom, and what to do next, within five seconds.
- **About page** — credibility, team, history, credentials.
- **Product / Service pages** — one page per offering, benefit-led, with proof and a CTA.
- **Landing pages** — single-purpose campaign destinations with navigation removed.
- **Blog / Resources** — the SEO and content-marketing engine.
- **Contact page** — multiple contact routes, map, hours, response-time expectation.
- **Trust pages** — testimonials, case studies, certifications, privacy policy, terms, refund policy.

4.2 Design Principles

4.2.1 The Core Principles

Principle	What it requires
Simplicity	Remove everything that does not serve the user's goal. Every added element competes with the CTA
Consistency	The same colours, fonts, button styles, spacing and terminology on every page, so users do not relearn the interface
Visual hierarchy	Make important elements visually prominent in proportion to their importance — size, weight, colour and position
Balance and alignment	Ordered use of a grid; alignment creates the perception of quality
Contrast	Sufficient contrast between text and background for readability and accessibility
Whitespace	Deliberate empty space that groups related items and gives the eye rest
Typography	Readable body size (16px+), limited font families, generous line height, restrained line length
Colour	A limited, purposeful palette; one accent colour reserved for actions
Responsiveness	The layout adapts to mobile, tablet and desktop — mobile-first by default
Accessibility	Alt text, keyboard navigation, colour-independent meaning, adequate tap targets
Navigation clarity	Conventional, shallow, labelled by user language and not internal jargon
Speed	Performance is a design constraint, not an engineering afterthought

TWO PRINCIPLES — CIE-III June 2026 (2 marks)

"Mention any two principles of website design." The scheme answer is **simplicity** and **consistency** — these principles improve readability and user experience.

4.2.2 Krug's First Law of Usability

"DON'T MAKE ME THINK."

A person of **average — or below average — ability** must be able to work out how to accomplish a task. The interface must be **self-evident and self-explanatory**. The good news: usability isn't rocket science.

4.2.3 The Seven Usability Attributes

Attribute	Test question
Useful	Does it do what people actually need?
Learnable	Can they figure it out?
Memorable	Do they have to relearn it on every visit?
Effective	Does it get the job done?
Efficient	Does it do so in a reasonable amount of time?

Attribute	Test question
Desirable	Do people <i>want</i> it?
Delightful	Is it enjoyable to use?

4.2.4 How People Actually Use the Web

There is a gap between how we *think* people use websites — reading carefully, like a novel — and how they actually do, which the heatmap reveals: **scanning, satisficing and muddling through**. *Satisficing* means choosing the first option that plausibly works rather than searching for the best one.

Why don't people read instructions?

1. It isn't important to them — they just want it to work.
2. They are on a mission and know they don't need to read everything.
3. If they find something that works, they stick to it rather than looking for a better way.

4.2.5 Billboard Design 101 — Design for Scanning, Not Reading

- **Follow visual hierarchy** — make important elements visually prominent.
- **Omit needless words** — the art of not writing for the web. *Happy talk must die; instructions must die.*
- **Make clickables obvious** — it must be instantly clear what can be clicked, to prevent frustration. Competition is one click away.
- **Provide breadcrumbs and street signs** — design clear, intuitive navigation so users always know where they are and how to get back.

4.3 User-Centred Design (UCD)

DEFINITION

User-Centred Design is a design philosophy and process in which the needs, goals, context and limitations of the end user drive every decision at every stage, and in which the design is validated by real users rather than by the design team's judgement.

4.3.1 The Principles of User-Centred Design

1. **Design is based on an explicit understanding of users, tasks and environments** — research first, design second.
2. **Users are involved throughout design and development** — not consulted once at the end.
3. **The design is driven and refined by user-centred evaluation** — usability testing at every iteration.
4. **The process is iterative** — design, test, learn, redesign.
5. **The design addresses the whole user experience**, not just the interface — including content, support and post-purchase.
6. **The design team includes multidisciplinary skills and perspectives.**
7. **Accessibility and inclusivity** — the design must work for users with differing abilities, devices and connection speeds.

TWO KEY PRINCIPLES — IMPROVEMENT CIE, 4 June 2025 (2 marks)

“Mention two key principles of User-Centered Design in website development.” Best two: **(1) design based on an explicit understanding of the user, their tasks and their context**, and **(2) iterative design validated by continuous user testing and feedback**.

4.3.2 The UCD Process

1. **Understand the context of use** — who the users are, what they are trying to do, on what device, under what constraints.
3. **Specify user requirements** — translate research into concrete functional and content requirements.
3. **Produce design solutions** — information architecture, wireframes, prototypes, then visual design.
4. **Evaluate against requirements** — usability testing, heuristic evaluation, A/B testing, analytics review.
5. **Iterate** until the design meets the user requirements — then continue iterating after launch.

4.3.3 What Website Visitors Actually Look For

A repeated 10-mark question — Improvement CIE, 4 June 2025: *“Discuss what website visitors typically look for when they land on a business webpage.”* Also asked as a 2-mark question about landing page elements.

What visitors want	How to deliver it
“Am I in the right place?”	A clear headline stating what the business does and for whom, visible without scrolling
“What’s in it for me?”	Benefit-led copy, not feature lists or company history
“Can I trust you?”	Testimonials, ratings, client logos, certifications, guarantees, real photographs, a physical address
“How much does it cost?”	Transparent pricing or at least a clear pricing range; hidden pricing is a leading cause of abandonment
“What do I do next?”	One prominent, unambiguous call-to-action
“Can I find what I came for?”	Simple navigation and a working search
“Is it fast?”	A page that loads in under about three seconds
“Does it work on my phone?”	A fully responsive, mobile-first layout
“How do I reach a human?”	Visible contact options — phone, chat, e-mail, hours
“Is it safe?”	HTTPS, recognised payment logos, a clear privacy and returns policy

TWO ELEMENTS ON A WELL-OPTIMISED LANDING PAGE — IMPROVEMENT CIE 4 June 2025 (2 marks)

Best two: **(1) a clear, benefit-led headline that matches the ad or link that brought the visitor there**, and **(2) a single prominent call-to-action button**. (Also acceptable: trust signals/testimonials, a hero image or product visual, a short form.)

4.4 Website Optimization

4.4.1 Definition and Importance

DEFINITION — CIE-III, June 2026 (2 marks)

Website optimization is the process of improving website performance, speed, usability and search visibility in order to increase traffic and conversions.

Importance of website optimization (CIE-III, June 2026, 10 marks — official scheme):

- Improves website loading speed
- Enhances user experience
- Increases search engine ranking
- Reduces bounce rate
- Improves conversion rate
- Supports mobile compatibility

Types of website optimization: technical optimization; content optimization; SEO optimization; mobile optimization.

Benefits: better customer engagement; increased sales and traffic; improved brand image.

4.4.2 The Optimization Techniques — The Full Answer

This is the answer to the recurring scenario “a start-up notices that visitors leave their website within a few seconds — as a web designer, how would you optimize the website?” (CIE-III, June 2026, 10 marks).

1. **Improve website loading speed** — compress images, minimise unnecessary scripts, use fast hosting services, enable caching and a CDN, and minify CSS and JavaScript.
2. **Create a responsive design** — ensure compatibility with mobile, tablet and desktop; design mobile-first.
3. **Improve navigation** — use simple menus and a proper page structure; keep important pages within two or three clicks.
4. **Enhance content quality** — attractive headings, meaningful visuals and clear information; remove needless words.
5. **Add strong call-to-action buttons** — “Buy Now”, “Register”, “Contact Us” — prominent, above the fold, and repeated.
6. **Improve SEO** — proper keywords, unique title tags and meta descriptions, heading hierarchy, image ALT text.
7. **Reduce bounce rate** — provide engaging, relevant content that matches the promise made by the referring ad or search result.
8. **Monitor website metrics** — analyse visitor behaviour using analytics tools and keep iterating.

Additional techniques for a fuller answer: **A/B test** headlines, CTAs and layouts; **simplify forms** by removing non-essential fields; **add trust signals** near the point of decision; **implement exit-intent offers**; **use heatmaps and session recordings** to locate friction; and **fix accessibility** so the site works for every visitor.

4.4.3 Image Optimization

(Improvement CIE, 28 August 2024, 2 marks: “How does image optimization contribute to overall website performance?”)

- **Reduces page weight and load time**, which directly lowers bounce rate and improves Core Web Vitals.

- **Improves mobile experience** on slower connections and limited data plans.
- **Improves SEO** — descriptive file names and ALT text make images discoverable in image search and help the page rank.
- **Improves accessibility** — ALT text is read by screen readers and displayed when images fail to load.
- **Techniques:** compress files; use modern formats (WebP, AVIF); size images to their display dimensions; serve responsive images with `srcset`; lazy-load below-the-fold images; and use a CDN.

4.4.4 Testing and Optimization in Web Design

SEE Oct/Nov 2023 asked (Q7b, 8 marks): “Describe the importance of testing and optimization in web design for Marketing. What tools and methods can be used?”

- **Why it matters:** design opinions are unreliable predictors of user behaviour; testing replaces assumption with evidence, de-risks redesigns, produces compounding conversion gains on all future traffic, and reveals device- and segment-specific failures invisible in aggregate data.

Method	What it finds	Tools
A/B and multivariate testing	Which version performs better on a defined goal	VWO, Optimizely, AB Tasty
Usability testing	Where real users get stuck, and why	UserTesting, Maze, moderated sessions
Heatmaps, scroll and click maps	What attracts attention and what is ignored	Hotjar, Microsoft Clarity, Crazy Egg
Session recordings	Hesitation, rage clicks, dead clicks, form abandonment	Hotjar, Clarity, FullStory
Analytics funnel analysis	The exact step at which users drop out	Google Analytics 4
Performance testing	Speed and Core Web Vitals	PageSpeed Insights, Lighthouse, GTmetrix, WebPageTest
Cross-browser and device testing	Rendering failures on specific clients	BrowserStack, LambdaTest
Accessibility auditing	Barriers for users with disabilities	WAVE, axe, Lighthouse
Technical SEO crawling	Broken links, duplicate meta, redirect chains	Screaming Frog, SEMrush Site Audit

4.5 Website Copy

4.5.1 Principles of Effective Website Copy

- **Lead with the benefit, not the feature.** Users buy outcomes, not specifications.
- **Write for scanning** — short paragraphs, meaningful subheadings, bullet lists, bold key phrases.
- **Front-load the value** — put the conclusion in the first line, not the last.
- **Use the customer’s language**, taken from reviews, support tickets and search queries — not internal jargon.
- **Be specific** — “ships in 24 hours” beats “fast delivery”.
- **Use active voice and second person** — “you get”, not “customers are provided with”.
- **Omit needless words.** Happy talk — welcome messages that say nothing — must go.
- **One idea per section**, with a heading that states that idea.
- **Make CTA copy explicit and active** — “Get my free trial” outperforms “Submit”.

- **Answer objections in the copy** where they arise, rather than hiding them in an FAQ.

4.5.2 The Relationship Between Design Principles and Copy

A 10-mark question in the Improvement CIE of 28 August 2024: *“Discuss the relationship between design principles and website copy.”*

Design and copy are not sequential layers; they are a single system. Copy without design is unreadable, and design without copy is empty.

Design principle	How it serves the copy
Visual hierarchy	Determines the order in which the copy is read; the headline must be visually dominant because it carries the core message
Typography	Controls whether the copy is read at all — line length, size and spacing govern readability
Whitespace	Groups related copy and gives the reader cognitive rest, increasing comprehension
Contrast	Ensures the copy is legible and directs attention to the CTA text
Consistency	Means the same tone of voice and the same button language appear everywhere, building trust
Imagery	Demonstrates visually what the copy claims verbally — proof, not decoration
Responsiveness	Ensures the copy retains its hierarchy on a small screen, where most users read it

Examples of effective integration: a hero section where a benefit headline, a supporting sub-line, a product image and one accent-coloured CTA button occupy the top of the page with nothing competing; a pricing table where visual weight highlights the recommended plan while the copy names the buyer it suits; a testimonial block where a customer photograph and a short pull-quote in large type do together what neither could do alone. **Examples of failure:** a beautiful layout with vague copy that never says what the company sells; or strong copy set in 11px grey text on a white background, which nobody reads.

4.6 Publishing a Basic Website

CIE-III of June 2026 asked this as a 10-mark scenario: “A college plans to publish its departmental website for admissions and student activities. Explain the complete process involved in designing and publishing the website.” The official scheme lists nine steps.

Step	Activity
1. Requirement analysis	Identify website objectives and user needs
2. Website design	Create the homepage, admission page, faculty page and event sections; produce wireframes and visual design
3. Content development	Add text, images, notices and contact details
4. Domain registration	Purchase a domain name such as www.college.edu
5. Web hosting	Select a hosting service to store the website files
6. Website development	Build using HTML, CSS and JavaScript, or a CMS platform such as WordPress
7. Testing	Check website speed, links, responsiveness and security
8. Publishing	Upload the website files to the hosting server
9. Maintenance	Regularly update notices and student information

4.6.1 Expanding Each Step

- **Requirement analysis** — define the audience (prospective students, current students, parents, recruiters), the primary goal (admission enquiries), and the success metric.
- **Information architecture** — map the sitemap and navigation before any visual design.
- **Design** — wireframe, then apply the design principles of §4.2, mobile-first.
- **Content development** — write scannable, benefit-led copy; obtain and optimise images; prepare downloadable documents.
- **Domain registration** — choose a short, memorable, relevant name; register with an accredited registrar; configure DNS.
- **Hosting** — select shared, VPS, cloud or managed hosting based on expected traffic; ensure an SSL certificate for HTTPS.
- **Development** — build with semantic HTML for accessibility and SEO; integrate a CMS so non-technical staff can update notices.
- **Pre-launch technical setup** — install analytics and Search Console, submit an XML sitemap, verify `robots.txt` does not block the site, and set up backups.
- **Testing** — functional testing of every link and form; cross-browser and cross-device testing; speed testing; security testing; accessibility audit; and content proofreading.
- **Publishing** — deploy files via FTP/SFTP or a Git-based pipeline, point DNS to the host, and verify HTTPS and redirects.
- **Post-launch maintenance** — regular content updates, software and plugin updates, security patching, backup verification, broken-link checks, and monthly analytics review.

4.7 Website Metrics and Developing Insight

4.7.1 Key Website Metrics

(Improvement CIE, 28 August 2024, 2 marks: “List any four key metrics used to measure the success of a website.”)

Metric	What it measures	What it tells you
Traffic (users / sessions)	Volume of visitors	Whether acquisition is working
Bounce rate	% leaving after one page without interaction	Relevance and first-impression quality
Average session duration	Time spent per visit	Depth of engagement
Pages per session	Pages viewed per visit	Whether users explore or leave
Conversion rate	% completing the desired action	Whether the site produces business value
Page load time / Core Web Vitals	Speed and stability	Technical health and its effect on abandonment
Traffic sources	Channel mix	Which marketing investments work
New vs returning visitors	Retention split	Whether the site earns repeat visits
Exit pages	Where sessions end	Which page is losing people
Cart abandonment rate	% starting but not completing checkout	Friction in the purchase flow
Cost per acquisition	Spend ÷ conversions	Efficiency of the whole funnel
Goal value / revenue	Money produced	The bottom line

FOUR-METRIC ANSWER

If asked for only four, name **traffic**, **bounce rate**, **conversion rate** and **average session duration** — these four cover acquisition, relevance, outcome and engagement respectively, which reads as a considered selection rather than an arbitrary list.

4.7.2 How Website Metrics Help Optimize for Marketing Effectiveness

(Improvement CIE, 4 June 2025, 2 marks)

- They **locate the problem precisely** — a high bounce rate on one landing page is actionable, whereas “the site isn’t working” is not.
- They **rank the fixes by impact** — the step losing the most users is fixed first.
- They **prove or disprove changes** through before-and-after comparison and A/B testing.
- They **reallocate budget** towards the channels producing conversions rather than traffic.
- They **reveal segment-specific failures** — for example a mobile-only checkout bug hidden by desktop averages.
- They **set realistic targets** by grounding goals in historical baselines.

4.7.3 Developing Insight — From Data to Decision

A metric is not an insight. The progression runs: **data** → **metric** → **insight** → **decision** → **action** → **measured result**.

1. **Observe** — the checkout completion rate is 22%, against an industry benchmark of 45%.
2. **Segment** — the gap is entirely on mobile; desktop is at 47%.

3. **Diagnose qualitatively** — session recordings show mobile users abandoning at the address form.
4. **Hypothesise** — “the nine-field address form is too long for a mobile keyboard; auto-fill and postcode lookup will reduce abandonment.”
5. **Test** — run an A/B test on the new form.
6. **Decide and implement** the winner.
7. **Re-measure** and feed the result back into the next hypothesis.

4.7.4 User Behaviour Analysis and Website Optimization

(SEE Oct/Nov 2023, 2 marks: “What is the impact of user behavior analysis on website optimization?”)

User behaviour analysis — heatmaps, scroll maps, click maps, session recordings and funnel reports — shows what users *actually do* rather than what they say or what the business assumes. Its impact: it identifies friction points precisely; it reveals ignored content and invisible CTAs; it exposes rage clicks and dead clicks on non-functional elements; it shows how far down the page users actually scroll, which determines what must be placed above the fold; and it generates the hypotheses that A/B testing then validates. Without it, optimisation is guesswork.

4.8 Mobile Marketing — Introduction

4.8.1 Definition

DEFINITION

Mobile marketing is a multi-channel digital marketing strategy aimed at reaching a target audience on their smartphones, tablets and other mobile devices — through mobile websites, e-mail, SMS and MMS, social media, apps and push notifications.

Mobile is disrupting the way people engage with brands. Everything that can be done on a desktop is now available on a mobile device — from opening an e-mail to visiting a website to reading content, all through a small screen. About **80% of internet users own a smartphone**, and mobile platforms host up to **60% of digital media** consumption.

4.8.2 Mobile Advertising vs Mobile Marketing — The Key Difference

EXAM ANSWER — asked in CIE-III June 2026, Improvement CIE 4 June 2025 AND Improvement CIE 28 August 2024

Mobile advertising focuses mainly on **paid promotional messages** delivered to mobile devices — banner and display ads, in-app ads, mobile search ads, interstitials and video ads. It is one *tactic*, it is always paid, and its goal is immediate visibility.

Mobile marketing is the **broader strategy** encompassing overall customer engagement through mobile — SMS, apps, push notifications, mobile websites, mobile social media, location-based marketing, mobile e-mail, QR codes and mobile commerce, including both paid and unpaid activity across the full customer lifecycle.

One line: *mobile advertising is a paid subset of mobile marketing.*

Basis	Mobile Advertising	Mobile Marketing
Scope	Narrow — one tactic	Broad — the whole strategy
Nature	Always paid	Paid and organic
Channels	Banner ads, in-app ads, interstitials, mobile search ads, video ads	Apps, mobile websites, SMS/MMS, push notifications, social, e-mail, QR, location-based, m-commerce
Objective	Immediate visibility, clicks and conversions	Long-term engagement, relationship and retention
Duration	Campaign-bound	Continuous
Interaction	Largely one-way	Two-way and interactive
Measurement	Impressions, clicks, CTR, cost per install	Full-funnel: engagement, retention, lifetime value

4.8.3 Mobile Web Marketing vs Mobile App Marketing

(SEE Oct/Nov 2023, 2 marks: “List any two differences between Mobile Web marketing and Mobile App marketing.”)

Basis	Mobile Web Marketing	Mobile App Marketing
Access	Through a browser; no installation required	Requires download and installation
Reach	Broader — anyone with a browser and a link	Narrower — only those who install

Basis	Mobile Web Marketing	Mobile App Marketing
Discoverability	Found through search engines (SEO)	Found through app store optimisation (ASO)
Engagement depth	Lower; session-based	Much higher; repeat usage and habit formation
Push notifications	Limited (web push)	Full push notification capability
Offline use	Generally unavailable	Possible
Device features	Limited access to camera, GPS, contacts	Full access to device hardware and sensors
Cost	Lower to build and maintain	Higher — separate iOS and Android builds

4.9 Benefits and Limitations of Mobile Marketing

4.9.1 Benefits

- **Reach** — mobile phones reach people about 15% more than internet marketing does, and mobile advertising draws more clicks.
- **Accessibility** — the mobile device is always at hand; mobile advertising follows people everywhere.
- **Time factor** — people are available on mobile around the clock, which is not possible with desktops.
- **Cost** — mobile advertising costs much less than other types of advertising, allowing more advertising for the same spend.
- **Personalized** — the message can be tailored; people find mobile messages more intimate than other internet marketing methods.
- **Reaches a broader market** — smartphones and tablets are cheaper, smaller and more portable than PCs, so people previously excluded by financial, geographical or technological barriers are now online.
- **Instantaneous results** — we always carry our phones, and they are usually switched on, so the message is received the moment it is sent.
- **Easy to work with** — creating elements for mobile is simpler and less costly than for desktop; promotions and incentives such as downloadable coupons can be stored and redeemed without an internet connection.
- **Convenient to use** — the small screen limits content, which forces creators to keep it basic and simple; simpler content also adapts better across mobile platforms.
- **Tracking response** — user response can be tracked almost instantaneously, and phone numbers work well as unique IDs because people keep them longer than e-mail addresses, helping build accurate buyer personas.
- **Huge viral potential** — mobile content is easily shared, producing a domino effect and extra exposure at no additional cost.
- **Mass communication made easy** — more people own phones than computers, and mobile allows **geo-targeting** (location-specific messages via GPS and Bluetooth) and demographic targeting by age and gender.
- **Micro-blogging benefits** — platforms such as Instagram and X place influence in the hands of ordinary people, so anyone can act as an influencer.
- **Mobile payment** — secure mobile payment environments let users purchase and pay bills without physical currency.

4.9.2 Limitations

- **Platforms too diverse** — mobile devices have no single standard; screen sizes vary and platforms use different operating systems and browsers, so one campaign for all of them is difficult.
- **Privacy issues** — users want their privacy respected, so marketers must offer clear opt-out instructions.
- **Navigation on a mobile phone** — small screens and no mouse make navigation difficult even with touch, so many ads go untouched because reviewing each one is tedious.
- **Ad fatigue and intrusiveness** — push notifications and interstitials are easily overused, driving uninstalls.
- **Regulatory constraints** — SMS and push marketing are governed by consent regulations (TRAI DND in India, GDPR in the EU).

4.10 Mobile Marketing Goals and Campaign Principles

4.10.1 The Seven Characteristics of a Successful Mobile Campaign

Derived from the Mobile Marketing Association's interviews with members and its awards analysis.

1. **Think “mobile first”.** The most successful campaigns are developed with a mobile-first mentality; starting from a mobile perspective gives the campaign a stronger foundation. Consider mobile the *connective tissue* to all media, since it supports and strengthens every channel.
2. **Leverage multi-screen usage patterns.** Smartphone and tablet users work across screens — watching ESPN on TV while using the ESPN app for other scores, or tweeting while watching a show. Brands leverage cross-screen usage to capture attention.
3. **Utilize the full spectrum of mobile tools and applications.** Mobile isn't just a mobile website *or* a display campaign *or* an app — it is a mobile website *and* a display campaign *and* an app, and much more.
4. **Integrate the mobile campaign into the traditional campaign.** Chevy generated 39 million total views by integrating its Chevy Game Time App with the concurrent Super Bowl TV campaign. Mobile campaigns should never be produced in a silo.
5. **Create a campaign that works across multiple screens.** Tablet users are often at the *top* of the sales funnel doing in-depth initial research, while smartphone users are often at the *bottom*, ready to purchase.
6. **Leverage every phase of the sales funnel.** Mobile visitors use it for search and discovery *as well as* for purchase and brand connection.
7. **Test your way to success.** Mobile is digital by nature, making it perfect for tracking and measuring. The second half of the battle is sifting through those insights and adjusting to improve future performance.

THE CLOSING IDEA

Mobile isn't simply a new sales channel or marketing tool. It is a **revolutionary new medium** that is transforming not only the way consumers connect with brands, but how they make purchases and stay engaged with them.

4.10.2 Geo-Targeting

EXAM ANSWER — SEE Jun/Jul 2025 (2 marks)

Geo-targeting in mobile marketing is the delivery of content, offers or advertisements to users based on their **geographic location**, determined through GPS, Wi-Fi, Bluetooth beacons, cell-tower triangulation or IP address.

Role: it makes messages locally relevant and timely — sending an offer when the user is physically near the store (geo-fencing); enabling “near me” discovery and click-to-map directions; supporting location-specific pricing, language and inventory; driving footfall to physical outlets; and improving ROI by eliminating spend on users outside the serviceable area.

4.11 Utilizing Mobile Marketing for Sales Promotions

4.11.1 Push Notifications

A repeatedly examined topic — SEE Oct/Nov 2023 (Q8a, 8 marks) and Improvement CIE 28 August 2024 (2 marks).

Push notification — a short message sent by an app directly to a user's device screen, appearing even when the app is not open.

How push notifications enhance sales promotions

- **Immediacy** — a flash sale can be announced to the entire installed base within seconds.
- **Urgency** — countdown and limited-stock messaging drives immediate action.
- **Personalisation** — notifications triggered by browsing or purchase history ("the jacket you viewed is now 30% off").
- **Cart recovery** — abandoned-cart reminders sent minutes after abandonment.
- **Geo-triggered offers** — a coupon delivered when the user enters a defined radius around a store.
- **Re-engagement** — win-back messages to users who have not opened the app in 30 days.
- **Loyalty and replenishment** — points-expiry alerts and reorder reminders for consumables.

Effective push notification strategies

1. **Segment before sending** — never broadcast to the entire base; irrelevant pushes drive uninstalls.
2. **Time it correctly** — send within the user's active hours in their own time zone.
3. **Cap frequency** — an explicit limit per user per week.
4. **Write with a single clear benefit and a verb**, within roughly 40 characters for the title.
5. **Use rich media** — images and action buttons materially raise engagement.
6. **Deep-link** the notification straight to the relevant screen, never to the home screen.
7. **Ask permission at the right moment** — request notification consent after the user has experienced value, not on first launch.
8. **A/B test** copy, timing and creative, and measure opt-out rate as carefully as click rate.

4.11.2 Mobile Sales-Promotion Techniques

Technique	How it works
SMS campaigns	High open rate (often 90%+); best for time-critical offers and OTP-verified coupon codes
Mobile coupons	Downloadable or in-app codes redeemable in store or online; can be used offline
In-app exclusive offers	Discounts available only through the app, driving installs and app engagement
Flash sales via push	Time-boxed offers announced by push to create urgency
Location-based offers	Geo-fenced coupons triggered near a store
QR codes	Bridge print, packaging and outdoor media to a mobile landing page or offer
Gamification	Spin-the-wheel, scratch cards and loyalty streaks to drive repeat opens
Mobile wallet passes	Offers saved to Apple/Google Wallet with location-triggered reminders
Referral programs	One-tap share of a referral code from within the app
Mobile-exclusive early access	App users get the sale hours before the website

4.11.3 Mobile Advertising Formats

Format	Description
Click-to-Call	Displays a phone number the user can tap to be connected directly to a call centre or sales centre. Research shows click-to-call ads drive a 6–8% average increase in click-through rates
Interstitials	Interactive ads that appear within an app; once the user opens the app the interstitial displays, and the user can click through to a landing page or close it
Click-to-Map	Geo-targeting sends messages to users in a specific location; clicking the ad opens a map identifying the nearest store, and clicking the map displays the contact information on the smartphone
Canvas and expandable ads	When clicked, the ad expands to cover the entire phone screen; it can be animated or incorporate rich media to enhance the user experience
Mobile search ads	Paid results on mobile SERPs, often with location extensions
In-app banner and native ads	Display units embedded in the app's content flow
Rewarded video	The user watches a video in exchange for in-app currency or content — high completion rates

Mobile display ads are effective for building brand awareness and generating clicks, leads and conversions. They need not link to a static landing page — linking to a dynamic page or experience produces improved engagement and higher conversions.

4.12 Online Applications (Mobile Apps)

4.12.1 Why Apps Matter for Marketing

A 10-mark question in the Improvement CIE of 28 August 2024: *“How do online applications serve as effective tools for mobile marketing?”*

- **Permanent presence** — the app icon sits on the home screen, creating continuous brand visibility.
- **Push notification access** — a direct, free, owned communication channel that does not depend on an algorithm.
- **Rich behavioural data** — in-app analytics reveal exactly how each user behaves, enabling deep personalisation.
- **Higher engagement and conversion** — app users typically browse more, convert more and spend more than mobile-web users.
- **Loyalty and habit formation** — points, streaks and saved preferences increase switching cost.
- **Device capability access** — camera, GPS, biometrics, wallet and contacts enable experiences the web cannot match.
- **Offline availability** — content and coupons remain usable without a connection.
- **Frictionless repeat purchase** — saved payment details and one-tap reorder.

4.12.2 App Business Models

- **Free apps supported by ads.**
- **Paid apps supported by download fees.**

- **Premium apps supported by in-app commerce.**
- **Free apps supported by brands** interested in connecting with customers.

4.12.3 App Creation Strategy — Three Rules

1. **Make sure your app solves a problem.** The most effective apps solve some problem for the user — they *facilitate a purchase* (Walmart, Lowe's, Sam's Club), *provide content* (The New York Times, CNN, USA Today), *create brand preference* (Coca-Cola, Band-Aid, Nike), or some combination. Analyse which of these your app will solve and begin the design process from there.
2. **Get inside the mind of your user.** Understand how the user will engage with the app — will they be at home or in the office? Do they want information, or simply to engage with the brand?
3. **Design with the end in mind.** Is the purpose to create brand preference? To facilitate a financial transaction? To reduce customer churn? Or all of these?

4.12.4 Key Features an App Should Incorporate

- **Fast onboarding** — value visible before any sign-up demand.
- **Personalised home screen** driven by behaviour.
- **Search and filtering** that works.
- **Push notification preferences** the user controls.
- **In-app offers, loyalty and wallet.**
- **One-tap checkout** with saved payment methods.
- **Order tracking and history.**
- **In-app support and chat.**
- **Social sharing and referral.**
- **Offline mode** for core content.
- **Analytics instrumentation** on every meaningful event.

4.12.5 Creating a Mobile Website

With a smartphone you can browse any website available on a PC, but those sites are generally unsuitable for a phone because they were not designed for one. The screen is much smaller and behaviour differs — a user may browse and read for hours on a desktop, but on a phone will typically read only a small amount of information over short periods. How the information is displayed, and how much of it there is, must therefore be reconsidered.

When designing a mobile website, consider:

- You can only view **one screen at a time** — design the navigation accordingly.
- There is **not much room for text**, so don't use much.
- Use **large buttons** for key calls to action.
- Think about **font usage** — make sure the important content really stands out.

The modern equivalent of this advice is **responsive design** — one codebase that adapts fluidly to every screen — which is now preferred over maintaining a separate mobile site, because it avoids duplicate content, splits no ranking authority and halves maintenance.

4.12.6 Mobile Analytics

SEE Oct/Nov 2023 asked (Q8b, 8 marks): “*Explain the significance of mobile analytics in mobile marketing campaigns. What key metrics should marketers track?*”

Significance: mobile analytics is the only way to see behaviour inside an app, where web analytics cannot reach. It reveals which acquisition sources deliver users who actually retain rather than merely install; it exposes where users abandon the onboarding or checkout flow; it enables cohort analysis so retention can be compared across releases; it supports A/B testing of in-app experiences; and it links marketing spend to lifetime value rather than to installs.

Metric group	Metrics
Acquisition	Installs, cost per install (CPI), install source/attribution, click-to-install rate
Activation	Onboarding completion rate, time to first key action, registration rate
Engagement	Daily and monthly active users (DAU/MAU), stickiness (DAU÷MAU), session length, sessions per user, screens per session
Retention	Day-1, Day-7 and Day-30 retention, churn rate, cohort retention curves
Monetisation	Conversion rate, average revenue per user (ARPU), average order value, lifetime value (LTV), LTV:CAC ratio
Notification performance	Push opt-in rate, delivery rate, open rate, opt-out rate
Technical	Crash rate, app load time, API latency, app store rating

4.13 Key Terms — Quick Revision

Term	One-line meaning
Web design	Creating visually appealing, user-friendly websites — layout, colour, typography, graphics, navigation, responsiveness
UI / UX	The visual interactive surface / the whole quality of the user's journey
Website optimization	Improving website performance, speed, usability and search visibility to increase traffic and conversions
User-Centred Design	Design driven by explicit understanding of users and validated by user testing, iteratively
Krug's First Law	"Don't make me think" — the interface must be self-evident
Satisficing	Choosing the first option that plausibly works rather than the best one
Visual hierarchy	Making important elements visually prominent in proportion to importance
Responsive design	One layout that adapts fluidly to mobile, tablet and desktop
Core Web Vitals	Google's page-experience metrics — LCP, INP, CLS
Above the fold	The area visible without scrolling
Website copy	The written content of a page — headlines, body, microcopy, CTA text
Happy talk	Empty welcome text that says nothing; should be deleted
Domain registration / hosting	Buying the site's address / renting the server that stores its files
Mobile marketing	Multi-channel strategy reaching users on mobile devices
Mobile advertising	The paid promotional subset of mobile marketing
Geo-targeting	Delivering content or offers based on the user's geographic location
Geo-fencing	Triggering an action when a user enters a defined geographic boundary
Push notification	A short message sent by an app to the device screen, even when the app is closed
Click-to-Call	A mobile ad format with a tappable phone number; lifts CTR by 6–8%
Interstitial	A full-screen ad displayed within an app
ASO	App Store Optimization — ranking an app in app store search
DAU / MAU	Daily / monthly active users; DAU÷MAU is "stickiness"
CPI / LTV	Cost per install / customer lifetime value
M-commerce	Commercial transactions conducted through a wireless internet-enabled device

4.14 Previous Year Questions — Unit IV

A. Two-Mark Questions (Part A)

1. What is Website Optimization? [CIE-III June 2026]

The process of improving website performance, speed, usability and search visibility in order to increase traffic and conversions.

2. Mention any two principles of website design. [CIE-III June 2026]

Simplicity and **consistency** — these principles improve readability and user experience.

3. Differentiate Mobile Advertising and Mobile Marketing. [CIE-III June 2026] / What is the key difference between mobile advertising and mobile marketing? [Improvement CIE 4 Jun 2025] / Define mobile advertising in one sentence. How does it differ from mobile marketing? [Improvement CIE 28 Aug 2024]

Mobile advertising focuses mainly on paid promotional messages delivered to mobile devices. **Mobile marketing** includes overall customer engagement through SMS, apps, social media and mobile websites. In one line: mobile advertising is a paid subset of the broader mobile marketing strategy.

4. Mention two key principles of User-Centered Design in website development. [Improvement CIE 4 Jun 2025]

(1) Design based on an explicit understanding of the users, their tasks and their environment. (2) Iterative design that is continuously refined through user involvement and user-centred evaluation.

5. How can website metrics help in optimizing a website for marketing effectiveness? [Improvement CIE 4 Jun 2025]

They locate problems precisely, rank fixes by impact, prove or disprove changes through testing, reallocate budget to converting channels, and expose segment-specific failures hidden by averages.

6. State two key elements that visitors commonly expect to see on a well-optimized landing page. [Improvement CIE 4 Jun 2025]

A clear benefit-led headline matching the ad or link that brought them there, and a single prominent call-to-action button. (Also acceptable: trust signals such as testimonials or ratings.)

7. How does image optimization contribute to overall website performance? [Improvement CIE 28 Aug 2024]

It reduces page weight and load time (improving Core Web Vitals and lowering bounce rate), improves the mobile experience on slow connections, improves SEO through descriptive file names and ALT text, and improves accessibility.

8. List any four key metrics used to measure the success of a website. [Improvement CIE 28 Aug 2024]

Traffic (users/sessions), bounce rate, average session duration and conversion rate. (Also acceptable: pages per session, page load time, traffic sources, new vs returning visitors.)

9. How can push notifications be used in mobile marketing to enhance sales promotions? [Improvement CIE 28 Aug 2024]

They deliver time-critical offers instantly to the installed base, create urgency for flash sales, recover abandoned carts, trigger location-based coupons when a user nears a store, and re-engage lapsed users — all through an owned channel that no algorithm throttles.

10. How can user-friendly design impact the overall effectiveness of a website? [Improvement CIE 28 Aug 2024]

It reduces cognitive effort so visitors can complete their task, which lowers bounce rate, increases time on site and pages per session, raises conversion rate, builds trust in the brand, encourages return visits, and — because search engines now mimic human preferences — indirectly improves organic ranking.

11. Why is it important to integrate SEO in website development? [SEE Jun/Jul 2025]

Architecture, URLs, rendering method, speed, heading structure and analytics are all fixed at build time. Retro-fitting SEO is expensive, forces URL changes that risk losing ranking authority, and often leaves staging `noindex` directives live in production.

12. What is the role of geo-targeting in mobile marketing? [SEE Jun/Jul 2025]

Geo-targeting delivers content and offers based on the user's location, making messages locally relevant and timely — driving footfall through geo-fenced offers, enabling “near me” discovery and click-to-map directions, supporting location-specific pricing and inventory, and improving ROI by eliminating spend outside the serviceable area.

13. List any two aspects of branding and consistency in web design. [SEE Oct/Nov 2023]

(1) A consistent visual identity — the same logo, colour palette, typography, imagery style and button design applied on every page. (2) A consistent tone of voice and terminology in all copy, including microcopy, error messages and CTA labels, so the brand reads as one coherent personality.

14. List any two differences between Mobile Web marketing and Mobile App marketing. [SEE Oct/Nov 2023]

(1) Mobile web is accessed through a browser with no installation and therefore has broader reach, whereas an app requires download and installation and reaches a narrower but far more engaged audience. (2) Apps have full push notification and device-feature access (camera, GPS, biometrics) and can work offline, whereas mobile web has limited push capability and device access.

15. What is the impact of user behavior analysis on website optimization? [SEE Oct/Nov 2023]

It shows what users actually do rather than what is assumed — identifying friction points, ignored content, invisible CTAs, rage clicks and true scroll depth — and generates the hypotheses that A/B testing then validates. Without it, optimisation is guesswork.

B. Ten-Mark and Eight-Mark Questions (Part B)**1. Explain the concept of Web Design and the importance of website optimization. [CIE-III June 2026]**

Define web design (§4.1.1) covering layout, colour, typography, graphics, navigation and responsiveness. Then give the six importance points, the four types of optimization (technical, content, SEO, mobile) and the three benefits, per §4.4.1.

2. A start-up company notices that visitors leave their website within a few seconds. As a web designer, explain how you would optimize the website to improve user engagement and conversion rate. [CIE-III June 2026]

Give the eight numbered techniques in §4.4.2 — speed, responsive design, navigation, content quality, strong CTAs, SEO, bounce-rate reduction and metric monitoring — each with the concrete sub-actions listed there. Strengthen the answer by opening with a diagnosis step (heatmaps and session recordings to find *why* they leave) and closing with A/B testing to validate the fixes.

3. A college plans to publish its departmental website for admissions and student activities. Explain the complete process involved in designing and publishing the website. [CIE-III June 2026]

Give the nine official steps in §4.6 — requirement analysis, website design, content development, domain registration, web hosting, website development, testing, publishing, maintenance — expanded with the detail in §4.6.1.

4. Discuss what website visitors typically look for when they land on a business webpage. Suggest effective design and content strategies to meet those expectations. [Improvement CIE 4 Jun 2025]

Use the ten visitor questions in §4.3.3 with the paired delivery strategy for each, then add the design principles of §4.2 and the copy principles of §4.5.1 as the systematic response.

5. Design a user-centered website layout for a new e-commerce startup targeting young urban professionals. How would you ensure optimal user experience and engagement? Include key design principles, optimization strategies, and website copy suggestions. [Improvement CIE 4 Jun 2025]

Research first: persona — 25–35, urban, mobile-first, time-poor, price-aware but convenience-driven; primary task — find and buy quickly on a phone during a commute. **Layout:** sticky header with search and cart; a hero section with one benefit headline and one CTA; a three-column category grid; a social-proof band with ratings; a personalised “recommended for you” row; a simple footer with trust and policy links.

Key design principles applied: mobile-first responsive layout; visual hierarchy placing the search bar and primary CTA highest; simplicity with generous whitespace; consistency in button style and colour; one accent colour reserved for actions; 16px+ type; tap targets of at least 44px; accessibility through ALT text and contrast. **Optimization strategies:** compressed WebP images and lazy loading for sub-3-second load; one-page guest checkout with a four-field form and saved payment; progress indicator in checkout; exit-intent offer; heatmaps and session recordings to locate friction; A/B tests on the hero headline and CTA. **Copy suggestions:** headline “Everything for your week, delivered by tomorrow”; sub-line “Free delivery over ₹499. Returns in one tap.”; CTA “Shop today's deals” rather than “Submit”; microcopy under the form reading “Takes 30 seconds — no account needed”; benefit-led product copy with specific claims.

Measurement: conversion rate, checkout completion, mobile bounce rate and average order value.

6. A travel agency has created a landing page for a limited-time offer on holiday packages. Despite a high number of clicks on the ads leading to the landing page, the conversion rate is disappointingly low. Evaluate the possible reasons for the low conversion rate. Suggest optimizations for key elements such as headlines, call-to-action buttons, and visuals. [Improvement CIE 28 Aug 2024]

Possible reasons: poor *message match* — the ad promised something the page does not repeat; a vague headline that does not restate the offer; the offer and price are below the fold; too many competing CTAs or none that is visually dominant; a long enquiry form demanding unnecessary details; no urgency despite the offer being time-limited; missing trust signals (no reviews, no certifications, no cancellation policy); slow page load, especially on mobile; generic stock imagery that does not show the actual destinations; hidden total cost or unclear inclusions; and navigation links that let visitors wander away from the page. **Optimizations — headlines:** restate the exact ad promise with specifics — “Kerala backwaters, 4 nights from ₹18,999 — book by Sunday”; add a sub-headline listing what is included. **CTA buttons:** one dominant, high-contrast accent-coloured button repeated above and below the fold, with active benefit copy such as “Reserve my package” instead of “Submit”, plus reassurance microcopy (“Free cancellation up to 7 days”). **Visuals:** replace stock photography with real destination and customer photographs, add a short itinerary video, and show a countdown timer for the deadline. **Additional:** cut the form to name, phone and travel date; add testimonials and ratings adjacent to the CTA; remove the site navigation from the landing page; compress images for a sub-three-second mobile load; and A/B test the headline and CTA. **Measurement:** conversion rate, form-start to form-completion ratio, scroll depth and session recordings to verify the fix.

7. How do online applications serve as effective tools for mobile marketing? What are the key features that businesses should incorporate into their apps to ensure they are maximizing marketing potential? [Improvement CIE 28 Aug 2024]

See §4.12.1 for the eight reasons apps are effective, §4.12.2 for the business models, §4.12.3 for the three app-creation rules, and §4.12.4 for the feature checklist.

8. A luxury cosmetics brand is planning to launch a flash sale exclusively through mobile devices. How would you design a mobile marketing campaign that not only drives awareness of the sale but also maximizes conversion rates during the limited time? [Improvement CIE 28 Aug 2024]

Pre-launch (awareness, 7 days out): teaser push notifications and SMS to the segmented installed base; Instagram and YouTube Reels with influencer previews; an in-app countdown banner; a “notify me” opt-in that captures intent and grants push permission; paid social and mobile display retargeting to past purchasers and lookalikes. **Launch (conversion window):** a timed push notification at each segment’s peak activity hour, deep-linked straight to the sale screen; app-exclusive early access one hour before the website, to drive installs; a visible countdown timer on the sale screen; personalised product rows based on browsing and purchase history; limited-stock indicators to create scarcity; one-tap checkout with saved cards and wallet support. **During (maximising conversion):** abandoned-cart push within 20 minutes; geo-fenced offers near flagship stores with click-to-map; live chat support in-app; free-shipping threshold prompts to raise average order value. **Post-launch:** thank-you and review-request push; a win-back offer to browsers who did not buy; and a wallet pass for the next drop. **Technical requirements:** sub-three-second load, server capacity for the traffic spike, and a fully responsive mobile-first design. **Measurement:** push open rate, sale-screen sessions, add-to-cart rate, checkout completion, conversion rate, average order value, revenue per push, opt-out rate and app installs during the window.

9. Assume you are launching a promotional campaign for a new product using mobile marketing. Prepare a detailed plan including mobile advertising channels, push notifications, app-based promotions, and integration with social media. [Improvement CIE 4 Jun 2025]

Objectives and audience: define a SMART objective and the mobile persona, including device, active hours and preferred platforms. **Mobile advertising channels:** mobile search ads on high-intent queries with location extensions; in-app banner and native ads on relevant apps; rewarded video for reach; interstitials at natural app breakpoints; click-to-call ads for enquiry-driven products; click-to-map ads to drive footfall; and expandable rich-media ads for the brand story. **Push notifications:** a sequenced plan — teaser, launch, reminder, last-chance — each segmented, deep-linked, frequency-capped and A/B tested, with permission requested only after the user has experienced value. **App-based promotions:** app-exclusive early access and pricing, in-app coupons, gamified spin-to-win, loyalty points, referral codes, wallet passes, and one-tap checkout. **Social media integration:** Reels and Stories with the campaign hashtag; influencer seeding; shoppable posts and product tags; a WhatsApp broadcast for order updates and offers; user-generated content contests; and retargeting audiences built from app and site events. **Cross-channel integration:** QR codes on packaging and print linking to the mobile landing page; consistent creative and offer across all touchpoints; “think mobile first” with mobile as the connective tissue between all media. **Measurement:** installs and CPI, push open rate, in-app conversion rate, coupon redemption, ROAS, and LTV by acquisition source.

10. Discuss the relationship between design principles and website copy. How can visual design elements and well-crafted content work together to enhance user experience and achieve website objectives? Include examples of effective design and copy integration. [Improvement CIE 28 Aug 2024]

See §4.5.2 — the principle-by-principle table, followed by the worked examples of successful integration (hero section, pricing table, testimonial block) and of failure (beautiful layout with vague copy; strong copy set in unreadable type).

11. What is the role of user Interface and user Experience designs in web design for marketing? How can businesses ensure a positive user Journey on their websites? [SEE Oct/Nov 2023, Q7a]

See §4.1.2 — the UI/UX comparison table and the eight ways to ensure a positive user journey.

12. Describe the importance of testing and optimization in web design for Marketing. What tools and methods can be used to analyze and improve Website performance? [SEE Oct/Nov 2023, Q7b]

See §4.4.4 — the case for testing and the method-and-tool table.

13. Discuss briefly on Push Notification in Mobile Marketing. Explain how can businesses use them to engage and retain Mobile App users? Provide examples of effective push notification strategies. [SEE Oct/Nov 2023, Q8a]

See §4.11.1 — the definition, the seven engagement and retention uses, and the eight effective strategies, with examples such as a 20-minute abandoned-cart reminder, a geo-fenced coupon on store approach, and a 30-day win-back message.

14. Explain the significance of mobile analytics in mobile marketing campaigns. What key metrics should marketers track to measure the success of their mobile strategies? [SEE Oct/Nov 2023, Q8b]

See §4.12.6 — the significance argument and the seven metric groups from acquisition through to technical health.

15. Evaluate the effectiveness of mobile marketing in facing market changes due to rapid technological advancements. [SEE Jun/Jul 2025, Q8a]

Where mobile marketing is effective: it is inherently adaptive because it is digital and measurable — campaigns can be tested and adjusted continuously (MMA principle 7); it reaches consumers wherever they are, at any hour; it spans the entire funnel from discovery to purchase; it costs less than traditional advertising; it produces first-party behavioural data that survives the loss of third-party cookies; and it enables geo-targeting, personalisation and instant response that no traditional channel can match. **Where it is strained by technological change:** platform fragmentation across devices, screen sizes and operating systems makes a single campaign difficult; privacy shifts (Apple's App Tracking Transparency, cookie deprecation, GDPR and DND regulations) have degraded attribution and targeting; ad fatigue and rising uninstall rates limit push frequency; and the pace of format change (from SMS to apps to Reels to AI assistants) forces continual re-skilling. **Evaluation:** mobile marketing remains the most resilient channel precisely because its measurability lets it adapt faster than the disruption — but only for organisations that build an owned first-party asset (an app and a permission-based list) rather than renting reach from platforms.

16. Create a strategy to use new digital channels like mobile apps, chatbots, and social media integration to strengthen a brand's global online presence. [SEE Jun/Jul 2025, Q8b]

Mobile app as the owned hub: a single global app with localised content, currency and language; personalised home screens; push notification consent captured after first value; loyalty and wallet integration; offline access; and full event instrumentation feeding a global analytics view. **Chatbots as the always-on layer:** deployed on the website, in the app and on WhatsApp and Messenger; handling FAQs, order tracking, returns and product discovery in multiple languages across all time zones; escalating to human agents with full context; and capturing conversational data that feeds product and content decisions. **Social media integration:** a hub-and-spoke model with a global brand account and regional handles; platform-native content rather than cross-posting; shoppable posts and product tags linking back to the app; regional influencer partnerships for cultural credibility; and social listening for share-of-voice and sentiment by market. **Cross-channel integration:** one customer profile unified across app, chat, social, e-mail and web through a CDP or CRM, so the conversation continues seamlessly across channels — the omnichannel synchronisation principle. **Governance:** a central brand system with regional flexibility; consistent visual identity and tone; and compliance with local privacy and messaging regulation. **Measurement:** a global dashboard tracking reach, engagement, app installs and retention, chatbot resolution rate, cross-channel conversion and lifetime value by market.

17. Formulate a mobile-based marketing plan for a local food delivery startup to reach a targeted student segment. [SEE Jun/Jul 2025, Q7b]

Audience: students aged 18–24 on campus, price-sensitive, mobile-only, peak ordering late evening and during exam weeks. **Objective:** 10,000 app installs and 3,000 first orders in one semester. **Acquisition:** campus geo-fenced mobile ads and Instagram Reels targeted to a 2 km radius around hostels; a student-verified first-order offer; QR codes on hostel noticeboards, canteen tables and fest banners; campus ambassador referral codes with a two-sided incentive. **App-based promotion:** student-only pricing tier; late-night “exam fuel” offers; group-ordering feature for hostel floors; loyalty streaks for repeat weekly orders; wallet passes for recurring discounts. **Push notifications:** timed to 9–11 pm and exam periods; segmented by past cuisine preference; abandoned-cart recovery within 15 minutes; frequency capped to avoid uninstalls. **Social integration:** campus meme-format Reels, UGC contests with a branded hashtag, WhatsApp broadcast groups per hostel for daily deals, and student influencer partnerships. **Retention:** subscription pass for unlimited free delivery, streak rewards, and win-back offers after 14 inactive days. **Measurement:** CPI, install-to-first-order rate, orders per active user, Day-30 retention, average order value, referral coefficient and LTV:CAC.

HOW UNIT IV IS EXAMINED

In the SEE, Unit IV is **Questions 7 and 8 with internal choice** (16 marks in two 8-mark sub-divisions), plus 2–3 Part-A objective questions. In the Improvement CIEs, this unit dominates alongside Unit V. The highest-probability topics are: **mobile advertising vs mobile marketing** (asked in three separate papers), **website optimization techniques for a low-converting site**, **the nine-step website publishing process**, **push notifications for sales promotion**, **design principles and website copy**, and **apps as mobile marketing tools**. Almost every Part-B question here is a *scenario* — always answer with a structured plan (objective → audience → channels → tactics → measurement) rather than loose description.
